Abstract

This study dealt with the role of information technology in the preliminary investigation, as one of the most important means used to achieve prompt justice. This study aims to shed light on the legal basis created by the Jordanian legislator in the code of criminal procedure in article (158), in addition to creating special system for the use of technical means in criminal procedures. The researcher used the methodology of the descriptive and analytical method by extrapolating the new texts in the Code of Criminal Procedure and the system of using modern technological means in criminal procedures and analyzing them. At the end of the study, the researcher reached a number of results and recommendations. The most prominent of these results is that it is difficult for the plaintiff, during the preliminary investigation through technical means, to elicit the reaction of the interrogated person, which causes confusion in understanding their body language, which affects the smooth conduct of the investigation. Remote investigation reduces time, effort, and expenses. One of the most prominent recommendations reached by the researcher is that a special definition of the concept of investigation must be provided, and the primary investigation must be carried out using modern technological means, and it is necessary to conduct the primary investigation using modern technological means Whenever it is necessary to maintain community peace and security.

Keywords: modern technical means, Primary investigation, primary investigation via information technology
